

# Recursion is fantastic...

And is often “handy” ...

# What's Up Next...

---

- Loop structures: **for** and **while**
- Writing some “bigger” programs
  - Secret Sharing (cryptography)
  - Games (Nim, Mastermind)
  - Data compression

That'll keep us entertained for a few weeks!

# Loops!

---

# Mystery 1

I love a good mystery!

```
def leppard(inputString):  
    outputString = ""  
    for symbol in inputString:  
        if symbol == "o":  
            outputString = outputString + "ooo"  
        else:  
            outputString = outputString + symbol  
    print outputString
```

```
>>> leppard("hello")
```

```
>>> leppard("hello to you")
```

# Mystery 2

I love a good mystery!

```
vowels = ['a', 'e', 'i', 'o', 'u']
```

```
def spamify(word):  
    for i in range(len(word)):  
        if word[i] not in vowels:  
            return word[0:i] + "spam" + word[i+1:]  
    return word
```

What's range?

```
>>> spamify("oui")
```

```
>>> spamify("hello")
```

```
>>> spamify("aardvark")
```

# for

---

```
for <variable> in <iterable>:  
    Do stuff!
```

```
for symbol in "blahblahblah":  
    print symbol
```

```
for element in [1, 2, 3, 4]: ...
```

```
for index in range(42): ...
```

Three uses of for!

I'd like to see four uses of three!

# while

---

```
while <condition>:  
    Do stuff!
```

```
i = 0  
while i < 100:  
    print i  
    i += 1
```

```
sum = 0  
i = 0  
while i < 10:  
    sum = sum + i  
    i += 1
```

Write equivalent for-loops.

Draw flow charts.

# Using for

---

```
def mapSqr(L):  
    '''
```

```
    Assume L is a list.  Return map(sqr, L).  
    '''
```

Do what?

# Move over Playstation!

```
import random

numbr = input("Give me a number:")
strng = raw_input("Give me a string:")

def play():
    print "Welcome!"
    secret = random.choice(range(1, 100))
    numGuesses = 0
    userGuess = 0
    while userGuess != secret:
        userGuess = input("Enter your guess: ")
        numGuesses += 1
        if userGuess == secret:
            print "You got it in ", numGuesses, " guesses!"
        elif userGuess > secret:
            print "Too high"
        else:
            print "Too low"
    print "Thanks for playing"
```

Printing strings, numbers, etc.

# Move over Playstation!

---

---

Can you spot the difference?

```
import random

def play1():
    print "Welcome!"
    secret = random.choice(range(1, 100))
    numGuesses = 0
    userGuess = 0
    while True:
        userGuess = input("Enter your guess: ")
        numGuesses += 1
        if userGuess == secret:
            print "You got it in ", numGuesses, " guesses!"
            break
        elif userGuess > secret:
            print "Too high"
        else:
            print "Too low"
    print "Thanks for playing"
```

# Good Design

*Programs must be written for people to read, and only incidentally for machines to execute. - Abelson and Sussman*

1. Design your program “on paper” first. Identify the separate logical parts and the input/output for each parts.
2. Once your design is established, write the function “signatures” (function name, inputs) and docstrings .
3. Fill in the code for a function, **test that function carefully, and proceed only when you are convinced that the function works correctly.**
4. Use descriptive function and variable names (how about `x`, `stuff`, `florg`, `jimbob`?).
5. Don’ t replicate functionality.
6. Keep your code readable and use comments to help! `# Here’ s one now!`
7. Avoid global variables unless absolutely necessary! Instead, pass each function just what it needs.
8. Use recursion and functional constructs (e.g. `map`, `reduce`, `filter`, `lambda`) where appropriate.

# Exercises

---

Implement factorial, using a for-loop.

Use a loop to implement `fib`, where

$$\text{fib}(0) = 0, \text{fib}(1) = 1, \text{fib}(n) = \text{fib}(n-1) + \text{fib}(n-2)$$

# An Example...

Tic tac toe

**Objective: Write a tic-tac-toe program that lets two human players play and stops when a player has won.**

Functions:

main(): Welcomes user, plays a game, asks if we want to play again

welcome(): Prints the welcome message

playGame(): Maintains a board and plays one game

getMove(board, player): Queries the player (1 or 2) for her/his move  
and changes the board accordingly

printBoard(board): Takes a board as input and displays it

gameOver(board): Evaluates a board to see if game over

```
# Tic-tac-toe by Ran Libeskind-Hadas
```

```
debug = True
```

```
def main():
```

```
    """This is the main function for the tic-tac-toe game"""
```

```
    welcome()
```

```
    while True:
```

```
        if debug: print "About to enter playGame"
```

```
        playGame()
```

```
        response = raw_input("Would you like to play again? (y or n): ")
```

```
        if not response in ["y", "Y", "yes", "Yes", "Yup", "si", "oui", "youbetcha"]:
```

```
            print "Bye"
```

```
            return
```

```
def welcome():
```

```
    """Prints the welcome message for the game.
```

```
    We might also print the rules for the game and any other  
    information that the user might need to know."""
```

```
    print "Welcome to tic-tac-toe!"
```

```
def playGame():
```

```
    """Play one game of tic-tac-toe"""
```

```
    if debug: print "Entering the playGame function"
```

```
    board = [ [" ", " ", " "], [" ", " ", " "], [" ", " ", " "]]
```

```
    player = 1
```

```
    while not gameOver(board):
```

```
        print "The board looks like this:"
```

```
        printBoard(board)
```

```
        getMove(board, player)
```

```
        if player == 1: player = 2
```

```
        else: player = 1
```

```
# Tic-tac-toe by Ran Libeskind-Hadas
```

```
debug = True
```

```
def main():  
    """This is the main function for the tic-tac-toe game"""  
    welcome()  
    while True:  
        if debug: print "About to enter playGame"  
        playGame()  
        response = raw_input("Would you like to play again? (y or n): ")  
        if not response in ["y", "Y", "yes", "Yes", "Yup", "si", "oui", "youbetcha"]:  
            print "Bye"  
            return
```

```

        getMove(board, player)  
        if player == 1: player = 2  
        else: player = 1
```

What's this?!

How 'bout:

```
Row = [ " ", " ", " " ]  
board = [Row, Row, Row]
```

Or

```
board = [ [ " ", " ", " " ] ] * 3
```

```
def gameOver(board):
    """Returns False if the game is NOT over. Otherwise, prints a message
    indicating which player has won and then returns True indicating that the
    game is over. THIS FUNCTION IS NOT IMPLEMENTED CORRECTLY!"""
    return False
```

```
def getMove(board, player):
    """Takes the board and the current player (1 or 2) as input.
    Asks the player for her/his move. If it's a legitimate move,
    the change is made to the board. Otherwise, the player
    is queried again until a valid move is provided."""
    print "Player " + str(player) + "'s turn"
```

```
def printBoard(board):
```

print # new line!

Fill these in!

```
>>> board = [ ["1", "2", " "], [ " ", "1", "2"], [ " ", " ", "1"] ]
>>> printBoard(board)
1 | 2 |
---
| 1 | 2
---
|   | 1
>>>
```

```

def gameOver(board) :

|   | 1

```

The main  
trick !

# Lab Problem: The Mandelbrot Set

Consider some complex number  $C$

$$z_0 = 0$$

$$z_{n+1} = z_n^2 + C$$

For which values of  $C$  does this *not* diverge?

# Lab Problem: The Mandelbrot Set

Consider some complex number  $C$

$$z_0 = 0$$

$$z_{n+1} = z_n^2 + C$$

For which values of  $C$  does this *not* diverge?

Hey,  
that's a  
fractal!

# Lab Problem: The Mandelbrot Set

Consider some complex number  $C$

$$z_0 = 0$$

$$z_{n+1} = z_n^2 + C$$

For which values of  $C$  does this *not* diverge?

It is known that we can approximate the divergence test by seeing whether  $z_n$  exceeds 2.
